The index is determined based on volatility of the equivalent of the value at risk (which relies on unit's historical prices) resulting from the adopted investment policy, and on the credit risk of the sub-fund. The index value may change. Even the lowest risk category does not mean that a given sub-fund is risk-free. ## Dictionary

**Sharpe's ratio** – this ratio shows the profitability of risk borne by the fund compared to safe investments (e.g. treasury bonds). The higher the Sharpe's ratio, the lower the risk at which the return of the fund is generated compared to safe investments.

**Standard deviation** – this ratio shows how risky the given fund is. The higher the ratio, the more volatile the price of a fund unit. This ratio is used to compare the risk of funds with a similar profile (e.g. equity funds).

**Duration** – this ratio shows the change in the value of the debt part of the fund in reaction to a change in interest rates. The higher the duration, the bigger effect of a change in interest rates on a change in the value of a fund unit i.e. the higher the risk connected with the same.

**YTM** – (yield to maturity) – this ratio shows the rate of return that investors obtain when buying a bond at the current market price and holding it in their portfolio until maturity.
